APPEAL BRIEF

Sir:

This is an Appeal Brief submitted pursuant to 37 C.F.R. § 41.37 for the above-referenced patent application.

I. Real Party in Interest

The real party in interest is XILINX, Inc. The above referenced patent application is assigned to XILINX, Inc.

II. Related Appeals and Interferences

Appellant is unaware of any related appeals, interferences or judicial proceedings.

III. Status of Claims

Claims 1-4, 7, 12-13, 15, 21, and 44 are rejected and are presented for appeal. Claims 5-6, 8-11, 14, 16-20, and 22-43 are cancelled. The appealed claims are in the attached Appendix of Appealed Claims.

IV. Status of Amendments

No amendment has been filed after the Final Rejection.

V. Summary of Claimed Subject Matter

In the embodiment set forth in claim 1, the invention provides a method of securing communication of configuration data between a field programmable gate array (FPGA) and an external storage device, the method comprises counting a first number of oscillations of a first oscillator on the FPGA during a predetermined time interval (FIG. 6, #62, #66; [0030], [0031]). A second number of oscillations of a second oscillator on the FPGA is also counted during the predetermined time interval (FIG. 6, #64, #66; [0030], [0031]). A ratio between the first number and second number of oscillations is generated. The ratio is a fingerprint that represents an inherent manufacturing process characteristic unique to the FPGA (FIG. 6, #66; [0031]). Encrypted configuration data is transmitted from the storage device to the FPGA (FIG. 2, #26; [0022]). The encrypted configuration data is decrypted in the FPGA using the fingerprint as a decryption key to extract the configuration data (FIG. 2, #28; [0023]).

In another embodiment as found in claim 12, a field programmable gate array (FPGA) is provided. The FPGA comprises a plurality of configurable logic elements being programmable with configuration data to implement a desired circuit design (FIG. 1, #12; [0018]). A fingerprint element on the FPGA generates a fingerprint representing inherent manufacturing process variations unique to the FPGA (FIG. 1, #18; [0018]). The fingerprint element includes first and second oscillators (FIG. 6, #62, #64; [0031]) and a sensing circuit (FIG. 6, #66; [0031]). The sensing circuit includes means for counting a first number of oscillations of the first oscillator and counting a second number of oscillations of the second oscillator during a predetermined time interval [FIG. 6, #66; 0031] and means for generating a fingerprint as a ratio between the first number and second number of oscillations [FIG. 6, #66; 0031]. The FPGA further comprises a decryption circuit (FIG. 1, #16; [0018], [0019]) coupled to receive encrypted configuration data. The decryption circuit is configured to decrypt the

encrypted configuration data using the fingerprint as a decryption key to extract the configuration data.

In the embodiment set forth in claim 7, the first and second oscillators comprise configurable logic blocks of the FPGA (FIG. 1, #18; FIG. 6, #62, #64; [0031]).

In the embodiment set forth in claim 44, the generating of the ratio includes dividing the first number of oscillations by the second number of oscillations ([0031]).

VI. Grounds of Rejection

Claims 1-4, 7, 12-13, 15, 21, and 44 stand rejected under 35 U.S.C. §103(a) as being unpatentable over "Erickson" (U.S. Patent No. 5,970,142 to Erickson) in view of "IBM-RNG" (IBM Technical Disclosure Bulletin "Integrated Circuit Compatible Random Number Generator").

VII. Argument

The rejection of claims 1-4, 7, 12-13, 15, 21, and 44 should be reversed because the Examiner has not established a *prima facie* case of obviousness under 35 U.S.C. §103(a) over the Erickson-IBM-RNG combination.

The Examiner has failed to establish a *prima facie* case of obviousness of claims 1-4, 7, 12-13, 15, 21, and 44 over the Erickson-IBM-RNG combination because all the limitations have not been shown to be suggested by the combination.

Claims 1, 2, 3, 4, 12, 13, 15

Claim 1 includes limitations of counting a first number of oscillations of a first oscillator on the FPGA during a predetermined time interval; counting a second number of oscillations of a second oscillator on the FPGA during the predetermined time interval; and generating a ratio between the first number and second number of oscillations, wherein the ratio is a fingerprint that represents an inherent manufacturing process characteristic unique to the FPGA. These limitations are not suggested by either of Erickson or IBM-RNG.

The clear teachings of IBM-RNG do not suggest the counting of the first and second numbers of oscillations for first and second oscillators. IBM-RNG's figure shows two ring oscillators 2 and 4 and only a single divide-by-N counter for oscillator 2. For the second oscillator 4, the clock port of the divide-by-2 stage flip-flop #6 is connected to the second oscillator, and the not-Q data port of the flip-flop #6 is connected to the flip-flop 6 data-in port. IBM-RNG's description states, "The purpose of the divide-by-two stage 6 between the high frequency oscillator 4 and the sampling flip-flop 8 is to obtain a 50% duty cycle at the sample input to avoid biased outputs." IBM-RNG's description further states, "Bias can be further reduced by passing the sampling flip-flop output through the Exclusive OR 10 and latch 12." (p. 334-335; the accuracy of the page citation could not be verified because no page numbers are present on the PTO-provided IBM-RNG document) Those skilled in the art will recognize that the output of IBM-RNG's second oscillator 4 is sampled, which is clearly not suggestive of counting the number of oscillations. Thus, IBM-RNG's figure and description clearly describe a random number generator in which the number of oscillations is counted for only one oscillator, and that count is used to sample the second oscillator.

Since IBM-RNG does not count the numbers of oscillations of first and second oscillators, IBM-RNG does not suggest the limitations of generating a ratio between the first number and second number of oscillations. Furthermore, not only does IBM-RNG fail to suggest generating the ratio of two oscillator counts and using the ratio as a fingerprint, but the teachings of IBM-RNG teach away from the use of the ratio as a fingerprint. As explained in paragraphs [0030] and [0031] of the present application the two oscillator counts and the ratio between the counts may be used to avoid fingerprint drift. In contrast, IBM-RNG's approach seeks to generate non-deterministic random binary numbers. IBM-RNG's approach seeks to "only use the jitter oscillator output as a seed for a pseudo-random shift register, which is capable of high statistical quality" in order to avoid the deterministic qualities of a conventional feedback shift register approach, from which "it is possible to predict future or past results once the structure of the device and one output are known." Thus, the claimed use of the ratio of oscillator counts is clearly not suggested by IBM-RNG since the claimed ratio is for

avoiding fingerprint drift, as compared to IBM-RNG's sampling that seeks to make a key value unpredictable.

Claims 2-4 depend from claim 1, and the limitations are not shown to be suggested for the reasons set forth above.

Independent claim 12 is directed to an FPGA and includes functional limitations similar to those discussed above in regards to claim 1. Thus, the limitations of claim 12 have not been shown to be suggested by the Erickson-IBM-RNG combination.

Claims 13 and 15 depend from claim 12, and the Examiner has not shown that the Erickson-IBM-RNG combination suggests the limitations of these claims for the reasons set forth for claim 12.

Appellant respectfully submits that the Examiner has not established a *prima facie* case of obviousness for claims 1, 2, 3, 4, 12, 13, 15 because he has not shown that all the limitations of the claims are shown or suggested by the Erickson-IBM-RNG combination.

Claims 7 and 21

Claim 7 depends from claim 1, and the Erickson-IBM-RNG combination neither shows nor suggests all the limitations of claim 1 as explained above. Furthermore, the Examiner has not shown that the limitations of claim 7 are suggested by the Erickson-IBM-RNG combination. Claim 7 includes the limitations that the first and second oscillators comprise configurable logic blocks of the FPGA.

IBM-RNG does not mention configurable logic blocks of the FPGA. IBM-RNG generally states, "The two-oscillator, or jitter oscillator, approach is of interest because it can be constructed entirely of standard logic circuits." IBM-RNG's figures shows standard logic circuits such as inverters, flip-flops, XOR logic gates, a multiplexer, and a feedback shift register. Beyond these logic elements there is no apparent suggestion of using configurable logic blocks of the FPGA. Also, there is no specific suggestion of the first and second oscillators comprising configurable logic blocks of the FPGA. Therefore, it is respectfully submitted that IBM-RNG does not suggest the limitations of claim 7.

Claim 21 depends from claim 12 and includes limitations similar to those of claim 7. Thus, the Examiner has not shown that the Erickson-IBM-RNG combination suggests the limitations of claim 21 for the reasons set forth above.

Appellant respectfully submits that the Examiner has not established a *prima facie* case of obviousness for claims 7 and 21 because he has not shown that all the limitations of the claims are shown or suggested by the Erickson-IBM-RNG combination.

Claim 44

Claim 44 depends from claim 1, and the Erickson-IBM-RNG combination neither shows nor suggests all the limitations of claim 1 as explained above. Furthermore, the Examiner has not shown that the limitations of claim 44 are suggested by the Erickson-IBM-RNG combination. Claim 44 includes the limitations of the generating of the ratio including dividing the first number of oscillations by the second number of oscillations.

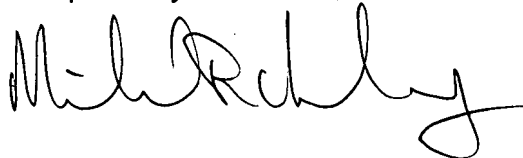

As explained above in regards to claim 1, IBM-RNG does not suggest the counting of the numbers of oscillations of two oscillators. Thus, for claim 44, IBM-RNG could neither teach nor suggest the claimed dividing of the first number of oscillations by the second number of oscillations. Therefore, the Examiner has not shown that the Erickson-IBM-RNG combination suggests the limitations of claim 44.

Appellant respectfully submits that the Examiner has not established a *prima facie* case of obviousness for claim 44 because he has not shown that all the limitations of the claims are shown or suggested by the Erickson-IBM-RNG combination.

VIII. Conclusion

In view of the above, Appellant submits that the rejections are improper, the claimed invention is patentable, and that the rejections of claims 1-4, 7, 12-13, 15, 21, and 44 should be reversed. Appellant respectfully requests reversal of the rejections as applied to the appealed claims and allowance of the entire application.

Respectfully submitted,

Michael R. Hardaway

**APPENDIX OF APPEALED CLAIMS FOR
APPLICATION NO. 09/765,907**

1. A method of securing communication of configuration data between a field programmable gate array (FPGA) and an external storage device, the method comprising:
 - counting a first number of oscillations of a first oscillator on the FPGA during a predetermined time interval;
 - counting a second number of oscillations of a second oscillator on the FPGA during the predetermined time interval;
 - generating a ratio between the first number and second number of oscillations, wherein the ratio is a fingerprint that represents an inherent manufacturing process characteristic unique to the FPGA;
 - transmitting encrypted configuration data from the storage device to the FPGA;
 - and
 - decrypting the encrypted configuration data in the FPGA using the fingerprint as a decryption key to extract the configuration data.
2. The method of Claim 1, further comprising:
 - configuring the FPGA using the configuration data.
3. The method of Claim 2, further comprising:
 - transmitting the fingerprint from the FPGA to an encryption circuit;
 - encrypting the configuration data using the fingerprint as an encryption key; and
 - storing the encrypted configuration data in the storage device.
4. The method of Claim 1, wherein the fingerprint is generated during power-up of the FPGA.
7. The method of Claim 1, wherein the first and second oscillators comprise configurable logic blocks of the FPGA.

12. A field programmable gate array (FPGA), comprising:
- a plurality of configurable logic elements being programmable with configuration data to implement a desired circuit design;
 - a fingerprint element for generating a fingerprint representing inherent manufacturing process variations unique to the FPGA, wherein the fingerprint element includes,
 - first and second oscillators; and
 - a sensing circuit including,
 - means for counting a first number of oscillations of the first oscillator and counting a second number of oscillations of the second oscillator during a predetermined time interval;
 - means for generating a fingerprint as a ratio between the first number and second number of oscillations; and
 - a decryption circuit coupled to receive encrypted configuration data, the decryption circuit configured to decrypt the encrypted configuration data using the fingerprint as a decryption key to extract the configuration data.
13. The FPGA of Claim 12, further comprising:
- a configuration circuit for configuring the configurable logic elements with the configuration data.
15. The FPGA of Claim 12, wherein the configuration data is encrypted using the fingerprint as an encryption key to generate the encrypted configuration data.
21. The FPGA of Claim 12, wherein the first and second oscillators comprise configurable logic blocks.
44. The method of claim 1, wherein the generating the ratio includes dividing the first number of oscillations by the second number of oscillations.

**APPENDIX OF EVIDENCE FOR
APPLICATION NO. 09/765,907**

Appellant is unaware of any evidence submitted in this application pursuant to 37 C.F.R. §§ 1.130, 1.131, and 1.132.

**APPENDIX OF RELATED PROCEEDINGS FOR
APPLICATION NO. 09/765,907**

Appellant is unaware of any related appeals, interferences or judicial proceedings.
